

# Assignment 5

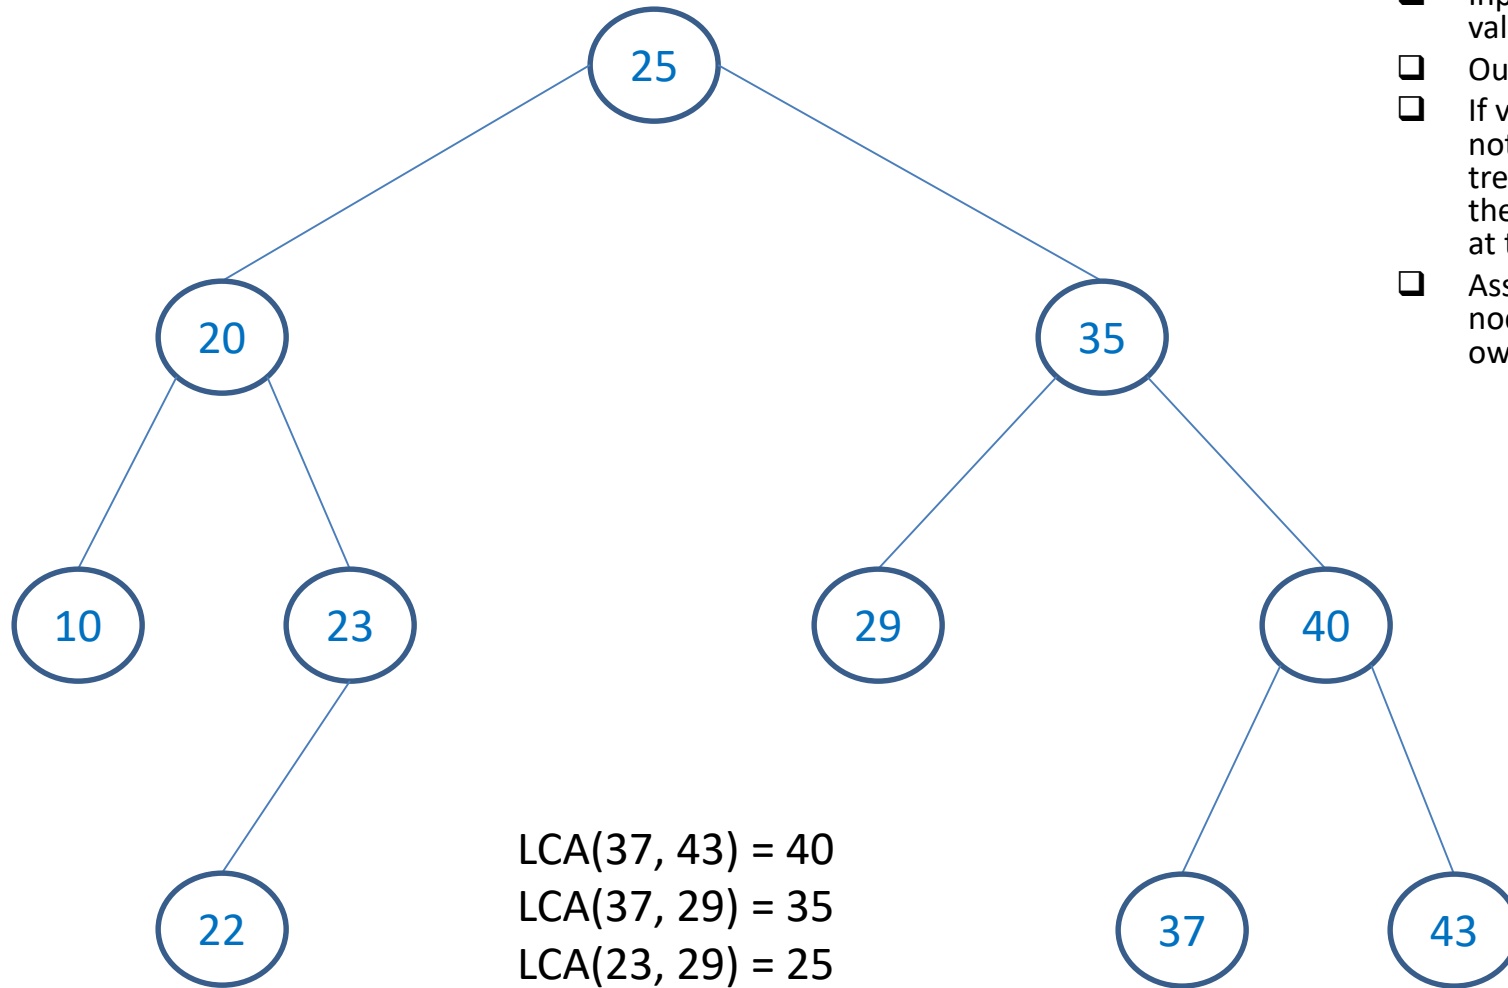

**A5\_ROLLNO.c/cpp**

**pds2016autumn@gmail.com**

# Binary Search Tree

- ❑ Given the preorder traversal, construct the binary search tree.
  - Merge Sort to get the inorder traversal, and construct the binary search tree.
  - Recursive postorder traversal

# Lowest Common Ancestor

- ❑ Input: Root, val1, val2
- ❑ Output: val / -1
- ❑ If val1/val2 does not exist in the tree, or one of the value is value at the root
- ❑ Assumption: A node can't be its own ancestor

LCA(37, 43) = 40  
LCA(37, 29) = 35  
LCA(23, 29) = 25  
LCA(22, 20) = 25  
LCA(25, 29) = -1

# Border Traversal

- ❑ Print data in the border nodes in anti-clockwise fashion
  - Left border top to bottom
  - Right border bottom to top
  - Leaf nodes from left to right
  - No node should be repeated
  - 25 20 21 32 40 37

# Mirror Tree of Binary Tree

# Counting Inversions

- ❑ Inversion: If  $i < j$  and  $A[i] > A[j]$ , then  $(i, j)$  is called an inversion.
- ❑ Given an array  $A$  of  $n$  integers, write a C/C++ program that counts the number of inversions in  $A$ .
- ❑ Example:
  - ❑  $A[] = \{1, 1, 3, 5\}$  Output: 0
  - ❑  $A[] = \{10, 30, 20\}$  Output: 1
  - ❑  $A[] = \{6, 4, 3, 2\}$  Output: 6
  - ❑  $A[] = \{6, 3, 4, 2\}$  Output: 5
- ❑ Modify the merge sort routine to count the number of inversions in  $O(n \log n)$  time.
